Successful experiments aboard the satellite “*Taiji-1*” herald China’s first program dedicated to gravitational wave detection in space.

About the cover:

Micius experiment supports classical quantum mechanics rather than “event formalism”, a model of quantum gravity, frustrating an effort to bridge quantum mechanics and general relativity, the “two pillars” of modern physics. For more, please refer to page 137.

Highlights

137 *Micius* Experiment Disproves a Model to Bridge Quantum Mechanics and General Relativity

A new finding shows that a tiny mark on the mRNA could cue the cell to another fate.

A spatio-temporal transcriptomic profile of mouse gastrulation tracks the early differentiation of cells.

A new model depicts how hydrogen (cyan and blue atoms) nanobubbles are formed within metals, shedding lights on how metal failure is caused in certain hydrogen-enriched environments, such as tungsten armor in the core of a fusion reactor.
